

Wireless, battery-free switch with receiver

Marka: **Virone** | Symbol: **WB-1** | Ean: **5908254822636**

PRODUCT DESCRIPTION

A single, wireless switch with a receiver operates without batteries. The electricity needed to send the radio signal from the transmitter is generated by pressing the button. You can use the device as a simple light switch or to control other electrical devices. One receiver can cooperate with up to 10 transmitters (buttons). This type of connection makes it possible to control the same lighting from many different locations. In addition, any number of receivers can be connected to one transmitter (button), which makes it possible to control many devices, for example, lighting in different rooms from one and the same button. The set includes

one transmitter (button) and one receiver. The switch has a built-in memory, so that even after power failure and restarting the receiver will remember the programmed transmitters (buttons). The switch is made of high quality plastic. It has a standard square shape and a simple but elegant appearance. It will look good on any wall.
