# onsemi

## **Dual Binary to 1-of-4 Decoder/Demultiplexer**

## MC14555B, MC14556B

The MC14555B and MC14556B are constructed with complementary MOS (CMOS) enhancement mode devices. Each Decoder/Demultiplexer has two select inputs (A and B), an active low Enable input (E), and four mutually exclusive outputs (Q0, Q1, Q2, Q3). The MC14555B has the selected output go to the "high" state, and the MC14556B has the selected output go to the "low" state. Expanded decoding such as binary-to-hexadecimal (1-of-16), etc., can be achieved by using other MC14555B or MC14556B devices.

Applications include code conversion, address decoding, memory selection control, and demultiplexing (using the Enable input as a data input) in digital data transmission systems.

#### Features

- Diode Protection on All Inputs
- Active High or Active Low Outputs
- Expandable
- Supply Voltage Range = 3.0 Vdc to 18 Vdc
- All Outputs Buffered
- Capable of Driving Two Low–Power TTL Loads or One Low–Power Schottky TTL Load Over the Rated Temperature Range
- NLV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free and are RoHS Compliant

#### MAXIMUM RATINGS (Voltages Referenced to V<sub>SS</sub>)

Parameter	Symbol	Value	Unit
DC Supply Voltage Range	V <sub>DD</sub>	-0.5 to +18.0	V
Input or Output Voltage Range (DC or Transient)	V <sub>in</sub> , V <sub>out</sub>	– 0.5 to V <sub>DD</sub> + 0.5	V
Input or Output Current (DC or Transient) per Pin	I <sub>in</sub> , I <sub>out</sub>	±10	mA
Power Dissipation, per Package (Note 1)	PD	500	mW
Ambient Temperature Range	T <sub>A</sub>	-55 to +125	°C
Storage Temperature Range	T <sub>stg</sub>	-65 to +150	°C
Lead Temperature (8-Second Soldering)	ΤL	260	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Temperature Derating: "D/DW" Packages:  $-7.0 \text{ mW/}^{\circ}\text{C}$  From 65°C To 125°C This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high–impedance circuit. For proper operation, V<sub>in</sub> and V<sub>out</sub> should be constrained to the range V<sub>SS</sub>  $\leq$  (V<sub>in</sub> or V<sub>out</sub>)  $\leq$  V<sub>DD</sub>.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either  $V_{SS}$  or  $V_{DD}$ ). Unused outputs must be left open.

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

Data labelled "Typ" is not to be used for design purposes but is intended as an indication of the IC's potential performance.
The formulas given are for the typical characteristics only at 25°C.

4. To calculate total supply current at loads other than 50 pF:  $I_T(C_L) = I_T(50 \text{ pF}) + (C_L - 50)$  Vfk where:  $I_T$  is in  $\mu$ A (per package),  $C_L$  in pF,  $V = (V_{DD} - V_{SS})$  in volts, f in kHz is input frequency, and k = 0.002.
